Project 1

Group 14: Jared Galloway, Tracie Jackson, Taro Unterburger

PROBLEM: The most common fear in today's healthcare industry is the fear of needles. We all know somebody who can't stand to look at the that sharp point as the doctor pulls it out of the drawer. But what if we could design a casing that hid the needle, yet still ensures laser accuracy for the physician using it? for our project we would like to attempt to solve this fear. After talking to multiple friends and personal experience, the worst part of the process is not the needle entering the skin, but the anxiety of looking at the long knife-looking needle before and overthinking that little prick that nobody seems to enjoy.

What we wanna fix:
